

ABSTRACT OF THE INVENTION

A golf club head includes a ferrule at one side for connecting a club, a striking face formed in a front side, and an angle indicating device fitted in an upper center portion of the club head easily seen by a player. The angle-indicting device has a pointing member and an angle indicating marks. Then a golf player can look at the point of the angle indicating marks where the top of the pointing member is pointing to, and adjust and confirm the angle between the striking surface of the club head and the ball according to the condition of the courses of the gold link. Thus a player can strike a ball with the best angle to achieve striking stability by means of the angle-indicating device.
